- Law of Large Numbers (LLN Central Limit

• Statistical inference involves **learning** (or inferring) some thing about a population given the availability of a sample from that population.

- Inferring mainly comprises two tasks:
 - estimation,
 - point estimate
 - interval estimate
 - Appothesis testing

Population, Parameters, and Random Sampling

Mathematical Statistics

Population

- Sampling Estimators and Estimates Unbiased estimator Efficiency Consistency Law of Large Numbers (LLN)
- Central Limit Theorem (CLT)

Population

Any well defined group of subjects, which would be individuals, firms, cities, or many other possibilities.

• Examples:

- blood / blood test sample
- preparing a pot of soup / a spoon of soup to try it
- all working adults in US / a sample from it (it's impractical to collect data from the entire population)

- \bullet Let Y be a r.v. representing a population with p.d.f. $f(y;\theta)$
- \bullet The p.d.f. of Y is assumed to be known, except for the value of θ

Random Sample

If Y_1, Y_2, \ldots, Y_n are independent r.v. with a common probability density function $f(y; \theta)$, then $\{Y_1, Y_2, \ldots, Y_n\}$ is said to be a **random sample** from $f(y; \theta)$ [or a random sample from the population represented by $f(y; \theta)$]

Population

Sampling

Estimators and Estimators Unbiased estimato Efficiency Consistency Law of Large Numbers (LLN) Central Limit

- When $\{Y_1, Y_2, \ldots, Y_n\}$ is a random sample from the density $f(y; \theta)$, we also say that the Y_i are *independent*, *identically distributed* (or i.i.d.) r.v. from $f(y; \theta)$
- Whether or not it is appropriate to assume the sample came from a random sampling scheme requires knowledge about the actual sampling process.

• Estimator = Rule

Estimator

Given a population,

in which this population distribution depends of a parameter θ you draw a random sample $\{Y_1, Y_2, \ldots, Y_n\}$.

Then an **estimator** of θ , say W, is a rule that assigns each outcome of the sample a value of θ .

• Example (on board) sample average and sample variance.

• Attention!

 $\mathsf{Parameter} \neq \mathsf{Estimator} \neq \mathsf{estimate}$

Estimator

Thus, an estimator is

$$W = h(Y_1, Y_2, \dots, Y_n)$$

Central Limit Theorem (CLT

Unbiased Estimator

An estimator W of θ , is an **unbiased estimator** if

 $E(W) = \theta$

• Unbiasedness does not mean that the **estimate** we get with any particular sample is equal to θ (or even close to θ).

Consistency

Law of Large Numbers (LLN

Central Limit Theorem (CLT

Bias

If W is **biased estimator** of θ , its bias is defined

$$\mathsf{Bias}(W) = E(W) - \theta$$

- Some estimators can be shown to be unbiased quite generally.
- **Example** (on white board): sample average (\bar{Y}) .

Theorem (CLT

• Even though being an unbiased estimator is a good quality for an estimator, we should not try to reach it at any cost. There are good estimators that are biased, and there are bad estimators that are unbiased (example: $W \equiv Y_1$)

Central Limit Theorem (CLT

Efficiency (Relative)

If W_1 and W_2 are two unbiased estimators of $\theta,\,W_1$ is efficient relative to W_2 when

 $\operatorname{Var}(W_1) \leq \operatorname{Var}(W_2)$

for all θ , with strict inequality for at least one value of θ .

• One way to compare estimators that are not necessarily unbiased is to compute the **mean squared error (MSE)** of the estimators.

Mean Squared Error (MSE)

$$\mathsf{ASE}(W) = E \left[(W - \theta)^2 \right] \\ = Var(W) + \left[Bias(W) \right]^2$$

• We can rule out certain silly/bad estimators by studying the *asymptotic* or *large sample* properties of estimators.

 \bullet It is related to the behavior of the sampling distribution when the sample size n gets large.

• If an estimator is not consistent (i.e., **inconsistent**), then it does not help us to learn about θ , even with with an unlimited amount of data.

- **Consistency:** minimal requirement of an estimator.
- Unbiased estimators are not necessarily consistent.

Law of Large Numbers (LLN)

Theorem (CLT

Consistency

An estimator W of θ , is a **consistent** if

$$W_n \xrightarrow{\mathsf{p}} \theta$$

Consistency

Let W_n be an estimator of θ based on a sample. Then, W_n is a **consistent estimator** of θ if for every $\epsilon > 0$,

$$\mathbb{P}(|W_n - \theta| > \epsilon) o 0$$
, as $n o \infty$

• Under general conditions, \bar{Y} will be near μ with very high probability when n is large.

Law of Large Numbers (LLN)

Let Y_1,Y_2,\ldots,Y_n be i.i.d. random variables with mean $\mu.$ Then,

$$\bar{Y}_n \xrightarrow{\mathsf{p}} \mu$$

- The **LLN** does NOT say that the estimator \overline{Y} will converge to any type of distribution. (Don't confuse with the Central Limit Theorem).
- The **LLN** just says that the estimator will converge to the true parameter, i.e, the sample average \bar{Y} will get closer and closer to the true parameter μ as you increase the sample size.

- Central Limit Theorem (CLT)

Central Limit Theorem (CLT)

Let Y_1, Y_2, \ldots, Y_n be i.i.d. with mean μ and variance σ^2 . Let,

$$Z_n = \frac{\bar{Y}_n - \mu}{\sigma/\sqrt{n}}$$

Then, Z_n will converge to a Normal distribution with mean $\mu = 0$ and variance $\sigma^2 = 1$, i.e., to a N(0,1) as $n \to \infty$
