- Things to know about the Natural Logarithm y = log(x):
 - is defined only for x > 0
 - $\ensuremath{\,^\circ}$ the relationship between y and x displays diminishing marginal returns
 - log(x) < 0, for 0 < x < 1
 - log(x) > 0, for x > 1
 - log(1) = 0
 - Property 1: $log(x_1x_2) = log(x_1) + log(x_2)$, $x_1, x_2 > 0$
 - Property 2: $log(x_1/x_2) = log(x_1) log(x_2)$, $x_1, x_2 > 0$
 - Property 3: $log(x^c) = c.log(x)$, for any c
 - Approximation: $log(1+x) \approx x$, for $x \approx 0$

KU Random Variable

Mathematical Tools Summation Operator The Natural Logarithm

Fundamentals of Probability

- Discrete & Continuous Randor Variable
- Features of Probability Distributions Expected Value Variance Standard Devia Covariance Conditional Expectation
- A **random variable (r.v.)** is one that takes on numerical values and has an outcome that is determined by an experiment.
 - \bullet Precisely, an r.v. is a function of a sample space Ω to the Real numbers.
- Points ω in Ω are called sample **outcomes, realizations, or elements**.
- Subsets of Ω are called **events**.

KU Random Variable

- Mathematical Tools Summation Operato The Natural Logarithm
- Fundamentals of Probability
- Discrete & Continuous Randor Variable
- Features of Probability Distributions Expected Value Variance Standard Deviat Covariance
- Conditional Expectation
- Distributions

- Therefore, X is a r.v. if $X:\Omega
 ightarrow \mathbb{R}$
- Random variables are always defined to take on numerical values, even when they describe qualitative events.

Example

• Flip a coin, where $\Omega = \{$ head, tail $\}$

KU Discrete Random Variable

Mathematica Tools

Summation Operato The Natural Logarithm

Fundamentals of Probability

Discrete & Continuous Random Variable

Probability Distributions Expected Value Variance Standard Deviati Covariance Conditional Expectation **Probability Function**

X is a **discrete** r.v. if takes on only a finite or countably infinite number of values.

We define the probability function or probability mass function for X by $f_X(x) = \mathbb{P}(X=x)$

istributions

KU Continuous Random Variable

Tools Summation Operato The Natural

Fundamentals of Probability

Discrete & Continuous Random Variable

Probability Distributions Expected Value Variance Standard Devia Covariance Conditional Expectation

Probability Density Function (pdf)

• A random variable X is **continuous** if there exists a function f_X such that $f_X(x) \ge 0$ for all x, $\int_{-\infty}^{\infty} f_X(x) dx = 1$ and for every $a \le b$,

$$\mathbb{P}(a < X < b) = \int_{a}^{b} f_X(x) dx$$

The function f_X is called the **probability density function** (pdf). We have that

$$F_X(x) = \int_{-\infty}^x f_X(t)dt$$

and $f_X(x) = F'_X(x)$ at all points x at which F_X is differentiable.

KU Joint Distributions and Independence

- Mathematical Tools
- Summation Opera The Natural Logarithm
- Fundamentals of Probability
- Discrete & Continuous Random Variable
- Features of Probability Distributions Expected Value Variance Standard Devia Covariance Conditional Expectation
- \bullet We are usually interested in the occurrence of events involving more than one r.v.

Example

 \bullet Conditional on a person being a student at KU, what is the probability that s/he attended at least one basketball game in Allen Fieldhouse?

Continuous Rando Variable

Features of Probability Distributions

Expected Value

Variance

-

Conditional

Distributions

Median

The **median** is the value separating the higher half from the lower half of a data sample.

For a **continuous** r.v., the median is the value such that one-half of the area under the pdf is to the left of it, and one-half of the area is to the right of it.

For a **discrete** r.v., the median is obtained by ordering the possibles values and then selecting the value in the "middle".

Mathematical Tools

Summation Operat The Natural Logarithm

Fundamentals of Probability

Discrete & Continuous Rando Variable

Features of Probability Distributions

Expected Valu

Variance

Standard Deviatio

Covariance

Conditional Expectation

• Motivation: (on white board)

Covariance

Let X and Y be two r.v. with mean μ_X and μ_Y respectively. Then, the **covariance** between X and Y is given by:

$$Cov(X,Y) = E [(X - \mu_X)(Y - \mu_Y)]$$

= E (XY) - E (X) E (Y)
= E (XY) - \mu_X \mu_Y

Notation: $\sigma_{X,Y}$

- Covariance measures the amount of linear dependence between two r.v.
- \bullet If ${\rm Cov}(X,Y)>0,$ then X and Y moves in the same direction.
